Industry 4.0 for More Sustainable Forest-based Value Chains

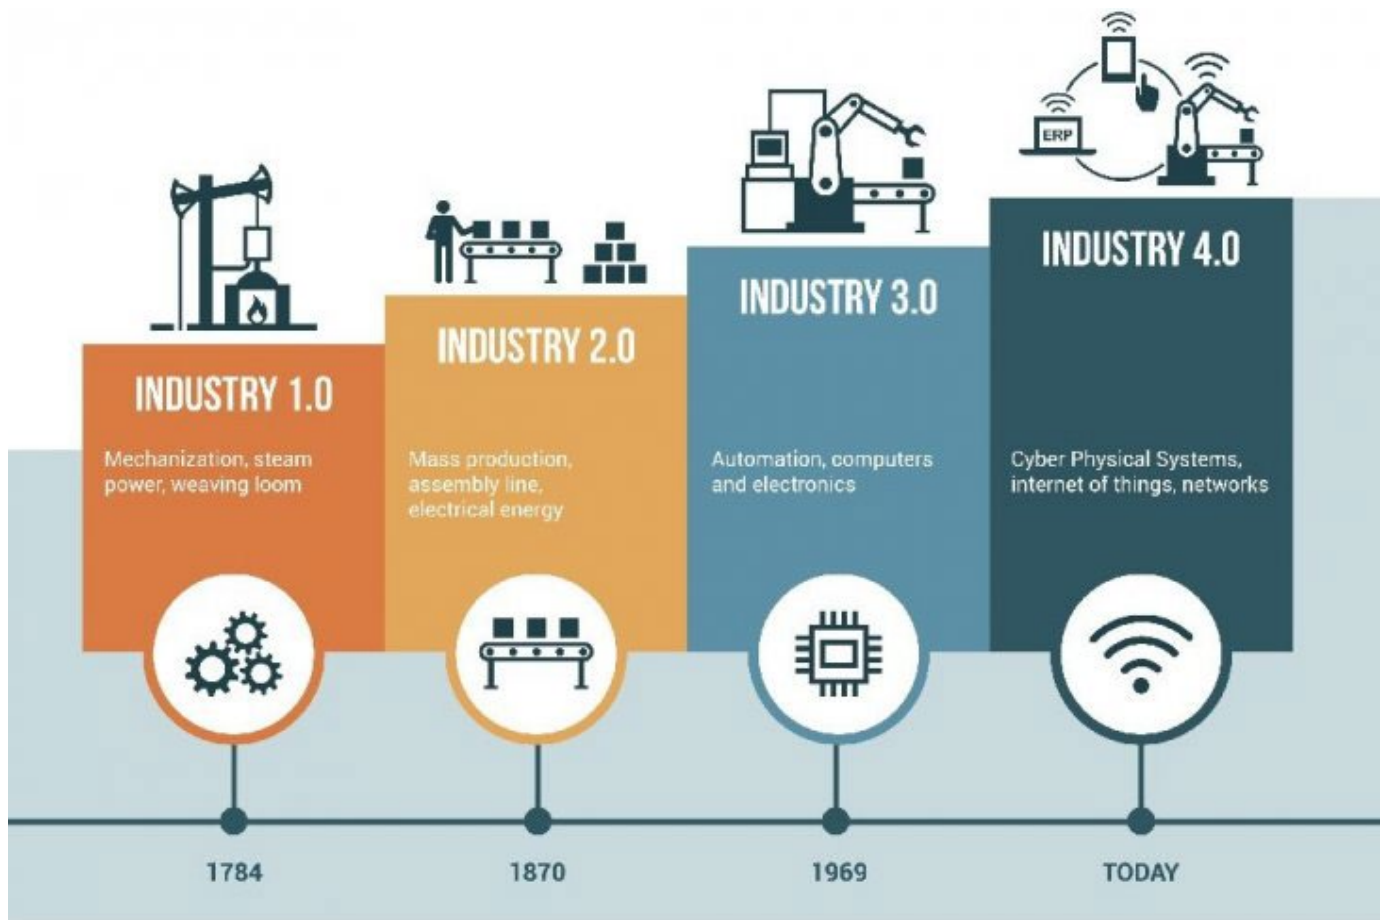

Research Professor Mauricio Acuna

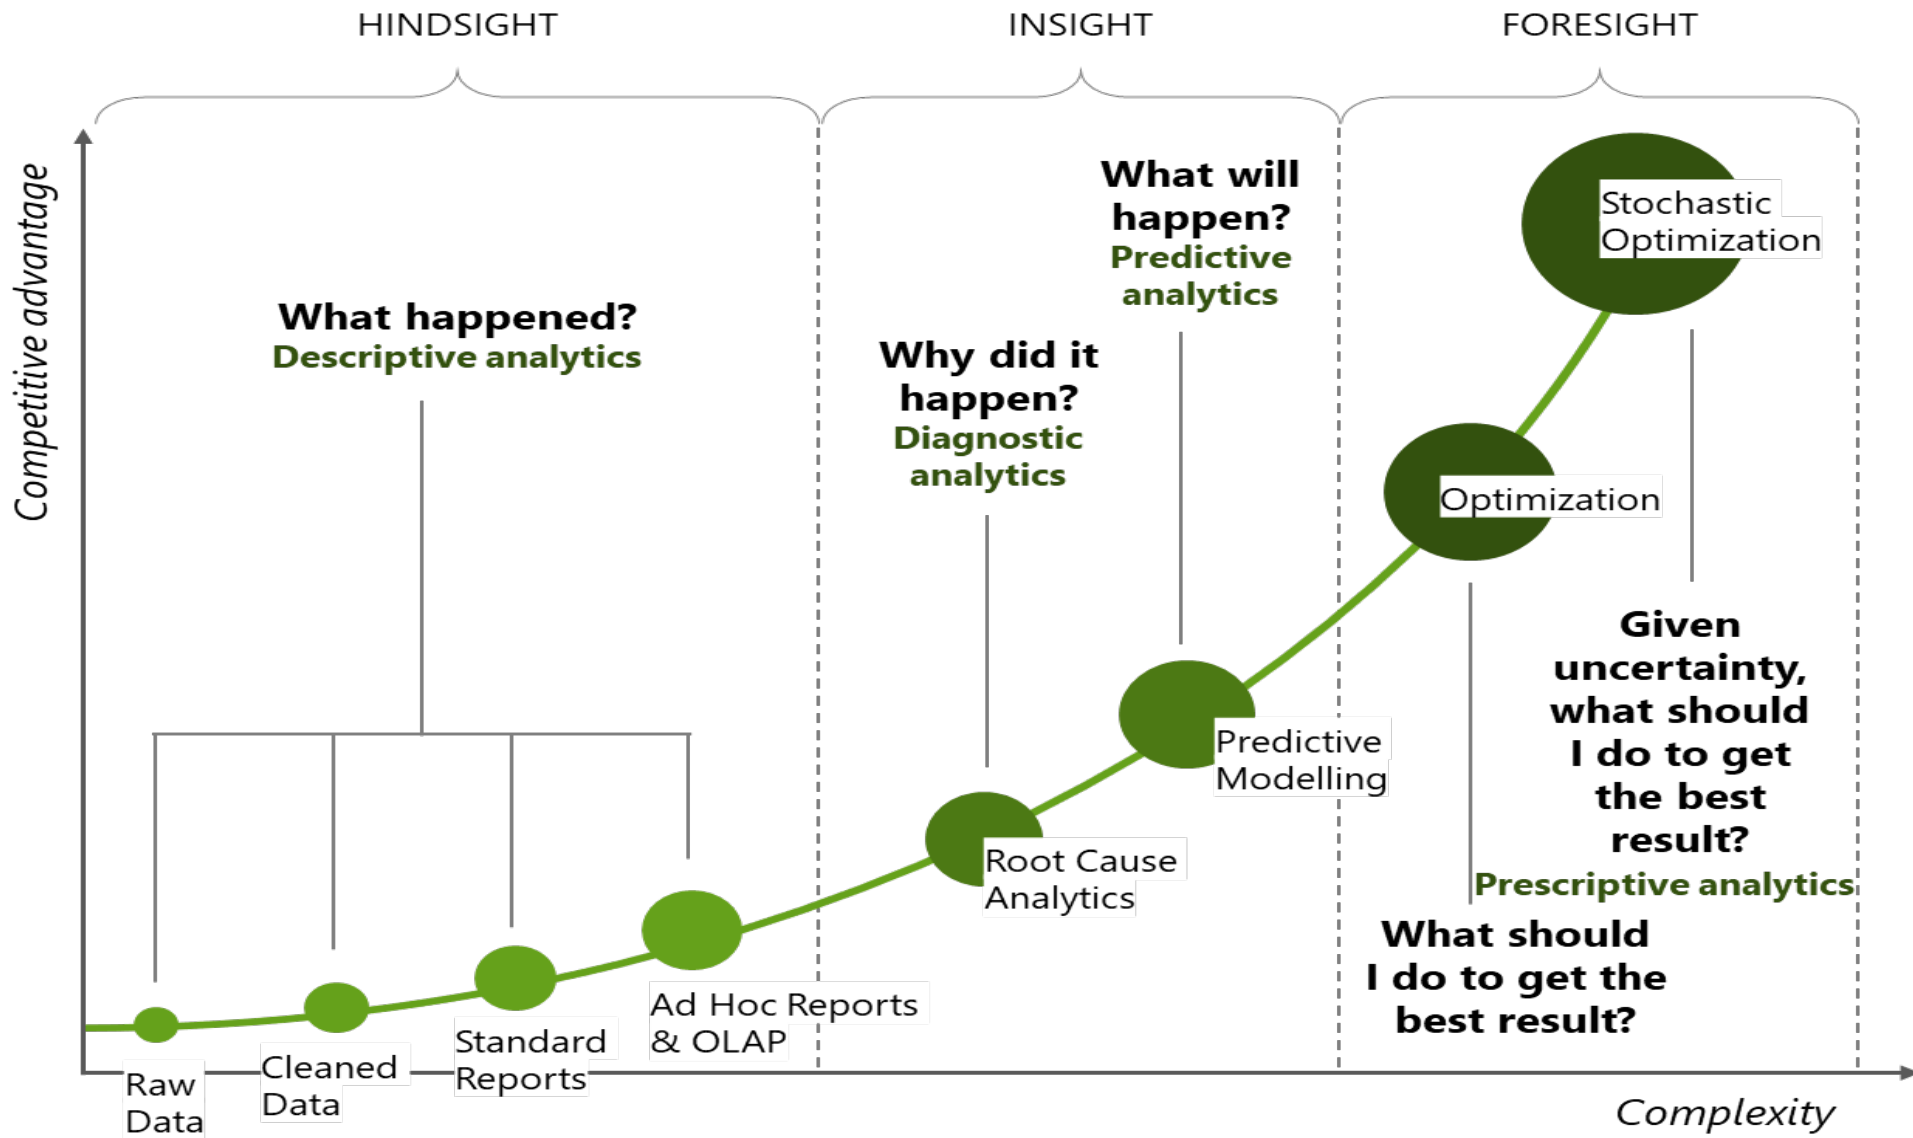

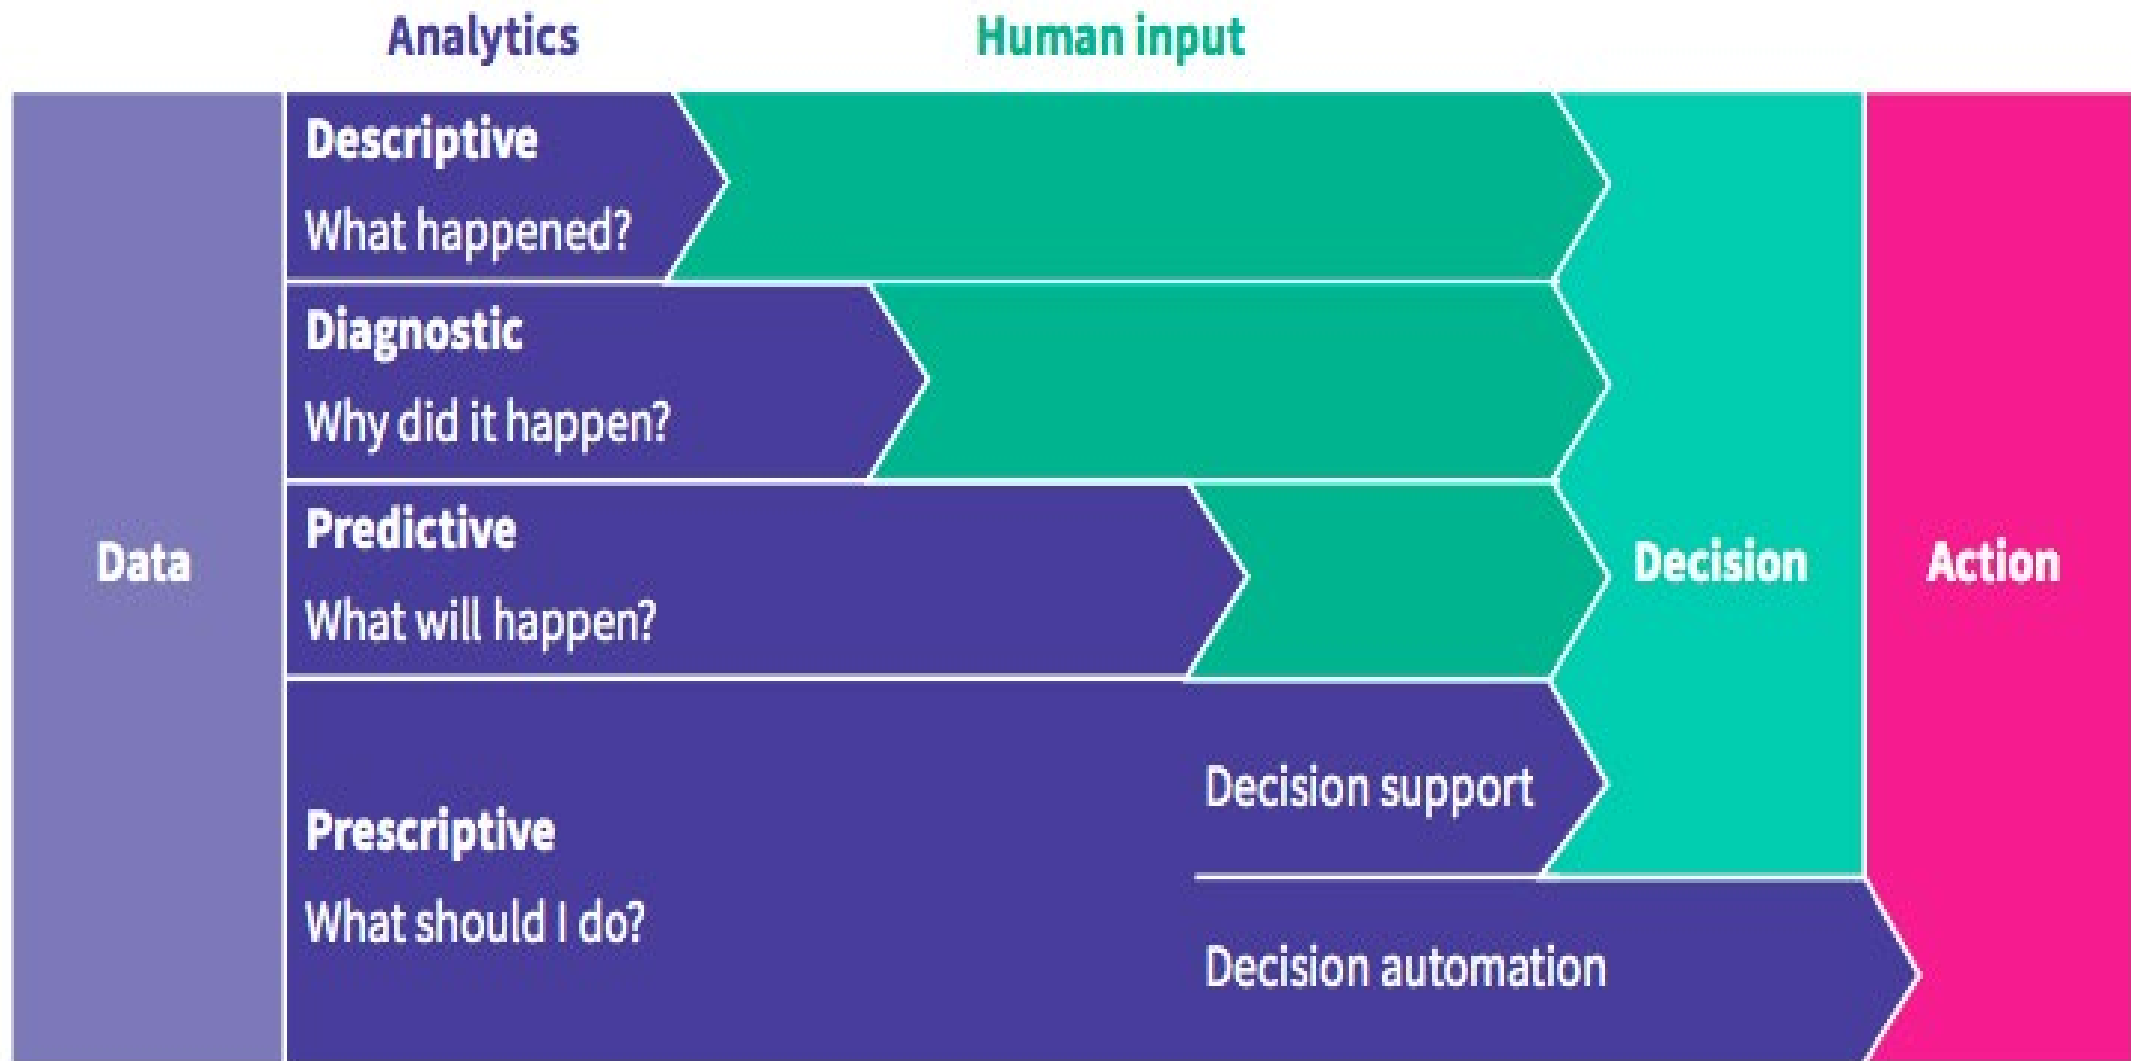

Industry 4.0: The 4th Industrial Revolution (4IR)

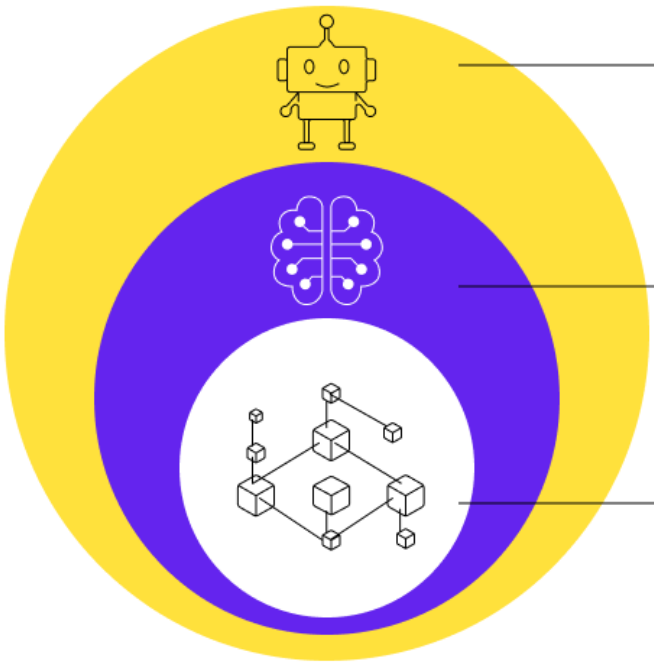

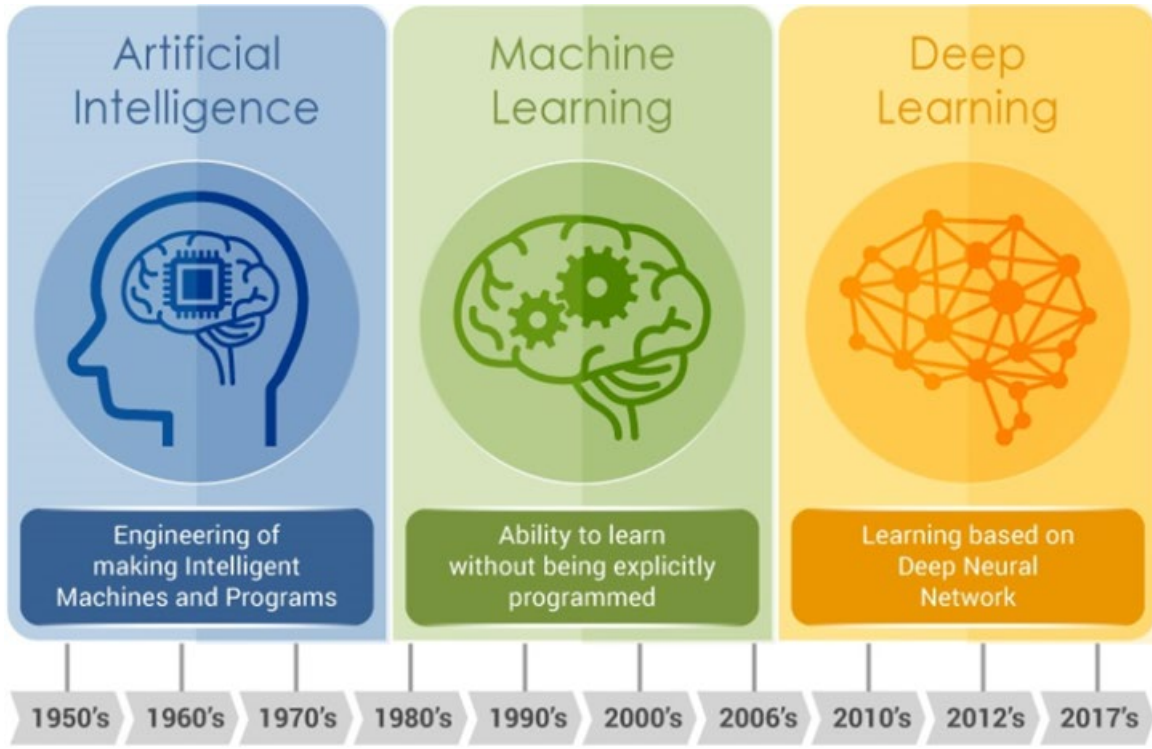

Data Analytics for improved decision making

**Artificial Intelligence (AI),
Machine Learning (ML),
Deep Learning (DL)
for improved decision making**

Artificial Intelligence
Computers that can imitate human intellect and behavior.

Machine Learning
Statistical algorithms that enable AI implementation through data.

Deep Learning
Subset of machine learning which follows neural networking.

**Why 4IR Techs
(Optimization, Automation, AI)
in forest-based value chains?**

- To address labor issues and increase safety (*social aspect*)
- To boost productivity and reduce costs (*economic aspect*)
- To mitigate the impact on flora, fauna, water courses, and soil (*environmental aspect*)
- To get immediate access to digital data for informed decision-making (*competitive aspect*)
- To promote resilience and sustainability throughout business and supply chains (*sustainability aspect*)

Barriers to AI adoption

The top 5 barriers to AI adoption (Forbes)

1. Initial investment
2. Cultural barriers
3. Fear
4. Shortage of talent
5. Lack of strategic approach

Top 3 challenges to AI/ML adoption

Sum of 1 to 3 rank

Enterprise maturity

Fear of unknown

Finding a starting point

Vendor strategy

4IR Applications

4IR Application: Wood supply chain optimization

4IR Application: Emerging and disruptive technologies

How a drone tractor works

Iowa-based Kinze Manufacturing Inc. has partnered with Jaybridge Robotics of Massachusetts to develop an autonomous agricultural equipment system it plans to launch in spring 2012. The system is designed to increase productivity, reduce input costs, and operate safely and efficiently. Kinze has not disclosed the final cost to the farmer. The system's components:

A small industrial computer is mounted in the cabin. Electronics allow the computer to drive the tractor and link it with external equipment, like planters or grain bins. An inertial measurement unit gives the system directional awareness. Wireless and cellular networks provide communication between tractor and farmer.

Ag camera: Allows the human supervisor to monitor operations from a remote location.

LIDAR: Emits a laser beam to detect objects without high metal or water content, like a PVC standpipe or a wooden fence post.

Standard automotive radar system: Borrowed from modern adaptive cruise control systems. Good for detecting metal objects and objects with high water content like livestock and people.

The "brain"
The software enables everything to work together. Because the computer is not particularly powerful, algorithms written into the program are efficient and application-specific, but general enough to be modified for other uses.

The Properties of Distributed Ledger Technology (DLT)

Programmable
A blockchain is programmable (i.e. Smart Contracts)

Secure
All records are individually encrypted

Anonymous
The identity of participants is either anonymous or pseudonymous

Distributed
All network participants have a copy of the ledger for complete transparency

Immutable
Any validated records are irreversible and cannot be changed

Unanimous
All network participants agree to the validity of each of the records

Time-stamped
A transaction timestamp is recorded on a block

4IR Application: Automated volumetric measurements

4IR Application: Sensors on harvesting equipment

4IR Application: Robotic systems

Take away messages

- **Consider how Industry 4.0 technologies can enhance your business;** establish a clear objective and roadmap (strategic approach)
- **Prepare your company and personnel for adopting 4IR technologies** (identify and address potential barriers to adoption)
- **You cannot manage what you don't measure**, so begin by collecting data, as effective management starts with measurement
- Leverage machine data to its fullest potential by utilizing **data analytics** and **machine learning** to identify inefficiencies, bottlenecks, and utilization patterns
- **Enhance decision-making** for sustainable and competitive forest operations, encompassing economic, environmental, and social aspects
- Champion a culture of **continuous improvement** within your company
- **Cultivate collaborations** with fellow entrepreneurs, technology firms, machinery manufacturers, universities, and research institutions (e.g., Luke) to stay at the forefront of 4IR advancements.

**Thanks for your
attention**
